

To figure out what to do, it's useful to identify places in the passage where the composition itself creates conditions that contribute to the illusion that a note belongs to a series of notes being played by a monophonic instrument.

The most important such conditions are proximity in pitch and proximity in time. Both of these are relative; in this passage, the inter-onset times within voices are  $\bullet$ ,  $\circ$ ,  $\circ$ ,  $\circ$  and  $\circ$ , and inter-onset intervals within voices are 0, 1, 2, 3, 5, 7 and 12 semitones, so it's reasonable to assume that melodic motion of a whole step or less and at the speed of a half-note or faster will be heard as progressions within a voice (as long as there is no conflict from other voices).

Given that, here are (1) the places where inter-voice motions are made clear by the composition itself, and (2) the places where there is possible ambiguity at the level of unison/half-/whole-step and quarter/half-note:

That's a conservative assesment; there are several places where quarter-note motion, though present in one voice, is distant enough from another voice (where there is step-wise motion) that it would not prevent the latter from cohering. Here's a revised assessment:

The tools at our disposal to eliminate the ambiguity are dynamics, onset timing, and note duration. Since I want to bring out the ricercare's theme anyway, I'll start by assuming I'll do that with dynamics, and see which ambiguities that resolves:

Okay, that's progress. You'll notice that some things resolve because they would have been unambiguous if not for the possible confusion with the theme, and with the theme put at a different dynamic level, it no longer conflicts.

That same principle can help out in another place; if the emphasis of the bass theme is extended, the whole notes (and one half note) in the tenor voice can recede into the background together:

There are also a couple of places where enough of the ambiguity has been resolved that the separation of voices in pitch space is plenty to keep things clear:

The easiest way to clear up the first remaining ambiguity, the one in the chain of soprano and alto whole notes, is to bring out the soprano and let the alto recede to the background:

A musical score in two staves (treble and bass clef). The soprano line (treble clef) has a box around a passage of whole notes. Red lines connect the notes in this passage, showing the soprano's line. The alto line (bass clef) has blue notes. The bass line (bass clef) has blue notes. The score shows a transition from a soprano and alto line to a soprano and bass line.

That left only that troublesome passage in the middle. There's actually another ambiguity in that passage, not at the unison/half-/whole-step level, but at the level of minor and major thirds:

A musical score in two staves (treble and bass clef). The soprano line (treble clef) has a box around a passage of whole notes. Red lines connect the notes in this passage, showing the alto's line. The alto line (bass clef) has blue notes. The bass line (bass clef) has blue notes. The score shows a transition from a soprano and alto line to a soprano and bass line.

What a mess. Conceptually, the simplest way to clarify this is to bring out the alto:

A musical score in two staves (treble and bass clef). The soprano line (treble clef) has a box around a passage of whole notes. Red lines connect the notes in this passage, showing the alto's line. The alto line (bass clef) has blue notes. The bass line (bass clef) has blue notes. The score shows a transition from a soprano and alto line to a soprano and bass line.

However, there are a couple of problems with this. The first is the transition from bringing out the soprano to bringing out the alto. Fortunately, this can be handled with a little finesse: if the dynamic level in the chain of suspensions is gradually reduced, it's possible to play the first alto B at a level which is both quieter than the preceding soprano D, and louder than the preceding alto C, such that it is clearly the alto voice, but is also beginning a slight crescendo; this can then be followed by a greater crescendo to the A, and the roles are reversed:

A musical score in two staves (treble and bass clef). The soprano line (treble clef) has a box around a passage of whole notes. Red lines connect the notes in this passage, showing the alto's line. The alto line (bass clef) has blue notes. The bass line (bass clef) has blue notes. The score shows a transition from a soprano and alto line to a soprano and bass line.

A more basic problem, though, is that the bass is already being brought out at that point. There are several things about this that present difficulties. It's another voice that's being brought out, so there's competition for the listener's attention. It's the bass, which masks all the voices except the soprano to a great degree. And it has the same rhythm as the alto. To make the alto distinct, we have to bring in the heavy artillery: timing. We will play the alto slightly after the beat (notated here as the rest of the notes being anticipated):

A musical score in two staves (treble and bass clef). The soprano line (treble clef) has a box around a passage of whole notes. Red lines connect the notes in this passage, showing the alto's line. The alto line (bass clef) has blue notes. The bass line (bass clef) has blue notes. The score shows a transition from a soprano and alto line to a soprano and bass line.

What I found most interesting about this was how much there was to deal with in that middle passage, and how far in advance its effects percolated.
